Evaluation for Web 12

User Interface:

1. Navbar dropdown is not working for mobile view.
2. It would be easier if a navigation to the home page was added somewhere. We have to go back multiple times to reach the main page.
3. The design could be made more responsive for ease of use in any device.

Database design:

1. Relation of users and comments and users and posts seems to be one to many. Instead of creating new tables for many to many relations, can we store the encrypted user id to comments and posts tables itself?

Random profile generator:

When the user base of the application increases, the random images and names generated based on data stored in the application may coincide for multiple users. So, is it possible to use random image generator or random profile generator available online?

Notification:

The application would become user friendly, if a user receives notification for the posts, he/she created or the posts they have commented on.

Overall, the website looks good!

Evaluation for Web 3

 Below is a list of issues we found on your website.

1. The webpage is not responsive on a mobile device

2. Active an inactive tag can be a separate column

3. We suggest a more readable text color for the table data especially the column names

4. When creating a new team, we see an extra missing field error "Key can't be blank" even though there is only one text field for "name"

5. Object and ID fields in their respective tables seem unnecessary.

6. Tables can be paginated and the Recent activities table can be enhanced by adding an advanced search option.

Overall, the website looks good!
